**«Standard Business Software –  
a rigid straight-jacket?  
Then Greenax will surprise you!»**

### So good it will win you over.

Greenax was developed to meet customer needs – with no compromise. The result is a standardised business software package based on the latest technology that sets new standards with regard to process orientation, functionality, versatility and security of investment, irrespective of the complexity and dynamics of the business models to be reflected – now and in the future.

Greenax succeeds because it adapts quickly and easily to changes in intra-company or inter-company processes. Its business and systems architecture makes this possible by configuration and customising, without expending any time and money on programming.

### Be open to innovation, and make profitable use of it.

Greenax strictly separates technology from business logic. Release updates can therefore readily be installed at any time – even if your processes are highly individually structured. New versions of the software integrate seamlessly with the existing environment. At the same time, the technology is continually improved. Your advantage? The product life cycle of Greenax is significantly longer, ensuring that operating costs remain low throughout its useful life.

### Connectivity without barriers.

In the office, on the move or at home – Greenax is available everywhere. This business software is based on the latest Java technology, making it fundamentally Web-oriented so that it can be used anywhere and at any time. Speaking of the Internet: Greenax can be accessed using a normal Web browser or directly via Web services, and the service-oriented architecture (SOA) includes your national and international partners in your joint processes. Precisely for this purpose, Greenax features a Business Process Integrator (BPI), which matches Greenax-internal and external modules to one another and provides time, event and process-oriented management of the inter-company data exchange.

### Puts you in pole position.

In the process control panel, you have a constant overview of all relevant information. All business processes with their interactions and interdependencies are clearly shown, so that any business model can be fully represented and controlled. Just click on a button in the user interface for more detailed information. The process control panel gives you full control and its intuitive user control meets the highest demands.

**«Greenax: convenience and outstanding design make it truly user-friendly.»**

### Everything with just one click.

Greenax provides efficient business intelligence at the click of a mouse. Customised business data are available in real time, providing a consolidated and precise basis for your decisions. Greenax saves time and money particularly because employees and business partners appreciate the userfriendly interface and can use Greenax efficiently.

The user interface of Greenax can be configured to meet your needs. Your personal configuration is retained, even with new releases; your individually configured processes, rule sets, checks and print settings remain fully intact through the update process. Practical help with the configuration is provided by the «Best Practice» settings. These are the result of sound business knowledge from trade and industry that you can make use of in your daily work. For the wholesale, technical distribution, agricultural, steel and building materials as well as food and consumables businesses, Greenax provides a complete package of tried and tested business processes.

«Your business generates value.  
Greenax provides the support you need.»

### Turn changes instantly to your advantage.

Business models and processes come in all shapes and colours. Both are subject to continuous change. A good business software package is able to tailor processes to customer requirements. Moreover, it can instantly incorporate any changes. Greenax adopts the new parameters – not only at the time of system deployment but also whenever your business must meet the challenge of changed market conditions.

With Greenax, you are always on the safe side. You can test the effects of changes in the business model before they are implemented live in the system. The test environment enables you to act extremely fast but safely, to significantly shorten the time-to-market and to stay the decisive nose ahead of your competition. The modelling not only saves time and reduces adjustment costs but also facilitates decisions that have to be taken to initiate a change process.

### Automatically programmed for success.

Business changes are usually complex and affect various departments. Change frequently extends beyond the bounds of the company itself so that supplier and customer relationships must be taken into account. In Greenax, the necessary steps can be planned precisely, taking all parties involved into consideration. All change processes are transparent and organised down to the finest detail with deadlines. Duplication and down-time are things of the past. Thanks to Greenax, you are and remain an attractive market player who can play to his strengths, especially in times of change.

**«Greenax models even the most complex processes with the utmost precision.»**

### Integration made easy.

Even without looking in a crystal ball, Greenax is equipped for the challenges of the future. Whatever the direction in which your present business model may be heading, strict process orientation and full configurability allow Greenax to guarantee that you can adapt quickly and, above all, easily to the changes in suppliers, customers, partners and competitors.

With the Business Data Integrator (BDI), it is easy to tie in existing systems with new or additional systems, not only within your own company but also with your suppliers, customers and other partners. Step by step, Greenax translates the vision of the business in real time into reality and, thanks to up-to-the-minute information and relevant business data, you can take the right decisions to keep your business on the road to success.

### A bill that adds up.

Business software users often find themselves faced with repeated investment for new acquisitions. In addition to the high costs, the implementation also leads to organisational expenditure. Greenax, on the other hand, keeps life sweet: instead of an expensive «Big Bang», you have gentle migration with the emphasis on proven features while advantageously factoring in innovation.

### The technological fount of youth.

With Greenax, you have a business software package that adapts dynamically to your business, continually renews itself and thus meets all requirements for long-term use.

Because technology and application of this business software package are strictly separated, you benefit from new releases that provide both functional extensions and the latest technology. Your business software remains, so to say, «forever young».

**«Would you rather look after the success of your business or after your business software?»**

### A smart investment.

Thanks to Greenax, there are no costly follow-up investments. This security of investment takes effect from day one. The continuous renewal of the software keeps total costs significantly lower than is the case for comparable products.

The Greenax renewal process is 100% via releases. The low and calculable software maintenance costs and uninterrupted working on a familiar system are advantages that your business partners will also appreciate. You can thus devote yourself entirely to daily business in the comforting knowledge that Greenax will not let you down.

## Maximum scalability.

Greenax is the process-oriented business software package for medium-sized businesses, can be used independently of company size and dynamically captures both internal and market-related changes. Do you wish to change your system platform or integrate new systems? No problem, as Greenax works platform-independently and is thus not subject to the annoying system requirements that are often associated with operating systems, hardware platforms or databases.

Business size is one thing, changes in organisation are another. Even adjustments in the business processes or a company reorganisation are easily mastered with Greenax. Greenax remains up-to-date, integrating and integrable, service and process-oriented, because its technological concept strictly complies with open standards. A business software package that adapts to your business instead of the other way round? That is just what you have with Greenax.

## Ready for your line of business.

Greenax is a leading business software package that has its strong points in the modelling and control of processes in the business fields of finance, materials trade, manufacturing and customer care. This is underlined by the «Best Practice» settings – ready-made business models from trade and industry – that are available to the customer. These are specific processes from the daily business in such areas as wholesale, technical distribution, agriculture, steel and building materials as well as food and consumables. These valuable pre-configurations that are available in the complete Greenax package or as separate business processes, save users crucial development time and leave you free to concentrate on what matters.

**«There is only one thing constant  
in business life – change.»**

**«A next-generation business software package conquers the world of processes.»**

### Any time, anywhere.

Greenax was designed for an increasingly mobile and globally networked business world. Users can work with the business software over the Internet from anywhere in the world, whether using one of the usual browsers, the Java Client or via Web services. The platform plays a subsidiary role, as the J2EE architecture is open and compatible.

Unlike office working, mobile working is often subject to frequent interruptions. Bearing this in mind, Greenax notes the time at which work was stopped or the program closed and, when you resume work, takes you straight back to the point at which you quit the program. You simply start the Greenax Client and, after logging in, continue where you left off.

### Always in touch with the customer.

The fact that Greenax can be accessed at any time over the intranet or Internet also has a positive effect on customer care. Because the business software is Web-based, you can make any of the functions available to your partners and customers on the World Wide Web and, in return, gain access to the required functions on partner systems, for example in portals, shop systems and marketplaces. The access protection ensures that your data will definitely remain within the defined circle of users.
